

Disciplina: Requisitos de Software

Professor: André Barros de Sales

Matrícula: 211031440 Nome: Pedro Gomes Oliveira

1. O objetivo da priorização foi claramente definido?

\$100

Prioritization is about thoughtfully allocating limited resources to achieve the maximum benefit from the investment an organization makes in a project. One way to make prioritization more tangible is to cast it in terms of an actual resource: money. In this case, it's just play money, but money nonetheless.

5. Foi explicado que requisitos de maior prioridade devem receber mais "dólares" para refletir seu peso?

Give the prioritization team 100 imaginary dollars to work with. Team members allocate these dollars to "buy" items that they would like to have implemented from the complete set of candidate requirements. They weight the higher-priority requirements more heavily by allocating more dollars to them. If one requirement is three times as important to a stakeholder as another requirement, she would assign perhaps nine dollars to the first requirement and three dollars to the second. But 100 dollars is all

6. Todos entendem que o orçamento de \$100 é um limite estrito e não pode ser excedido?

them. If one requirement is three times as important to a stakeholder as another requirement, she would assign perhaps nine dollars to the first requirement and three dollars to the second. But 100 dollars is all the prioritizers get—when they are out of money, nothing else can be implemented, at least not in the release they are currently focusing on. One approach is to have different participants in the prioritization process perform their own dollar allocations, then add up the total number of dollars assigned to each requirement to see which ones collectively come out as having the highest priority.

8. Os "dólares" de todos os participantes foram somados para determinar a prioridade coletiva de cada requisito?

Give the prioritization team 100 imaginary dollars to work with. Team members allocate these dollars to "buy" items that they would like to have implemented from the complete set of candidate requirements. They weight the higher-priority requirements more heavily by allocating more dollars to them. If one requirement is three times as important to a stakeholder as another requirement, she would assign perhaps nine dollars to the first requirement and three dollars to the second. But 100 dollars is all the prioritizers get—when they are out of money, nothing else can be implemented, at least not in the release they are currently focusing on. One approach is to have different participants in the prioritization process perform their own dollar allocations, then add up the total number of dollars assigned to each requirement to see which ones collectively come out as having the highest priority.

9. Foi esclarecido sobre o risco de um participante "manipular" o resultado, alocando todos os \$100 a um único item?

can "game" the process to skew the results. For instance, if you really, REALLY want a particular requirement, you might give it all 100 of your dollars to try to float it to the top of the list. In reality,

10. Levamos em consideração que o esforço relativo ou o custo de implementação não é refletido nesta priorização?

you'd never accept a system that possessed just that single requirement, though. Nor does this scheme take into account any concern about the relative amount of effort needed to implement each of those requirements. If you could get three requirements each valued at \$10 for the same effort as

11. A equipe compreende que esta classificação reflete unicamente o valor percebido pelos participantes?

of those requirements. If you could get three requirements each valued at \$10 for the same effort as one valued at \$15, you're likely better off with the three. The scheme is based solely on the perceived value of certain requirements to a particular set of stakeholders, a limitation of many prioritization techniques.
